ms-audit-ledger (S6) - PostgreSQL (Aurora) + S3 Object Lock, PER CELL
decision
(partitioned by month)
● event_id : uuid «PK»
● occurred_at : timestamptz «PK, partition key»
● engagement_id : uuid
● firm_id : uuid
● user_id : uuid
● decision : varchar «CHECK»
● from_version : varchar
● to_version : varchar
● summary_id : uuid
discrepancy : varchar «CHECK» NULL
● region : varchar
audit
● created_by : uuid
● created_at : timestamptz
● updated_by : uuid
● updated_at : timestamptz
● state : varchar «CHECK»
state CHECK:
summary_provenance: ACTIVE -> INVALIDATED (ChangeSummaryInvalidated.v1, EV-07)
sealed_batch: SEALED (constant)
outbox: PENDING -> PUBLISHED (relay of AuditBatchSealed.v1 to the cell bus); purged after TTL_outbox
summary_view, decision, offer_lifecycle, control_evidence: ACTIVE (constant;
append-only, app role without UPDATE/DELETE: updated_* = created_*)
decision.decision CHECK: APPLIED | DECLINED; discrepancy CHECK: NONE | STALE_OFFER | APPLIED_WITHDRAWN (EV-20).
summary_provenance.kind CHECK: DETERMINISTIC | NARRATIVE.
offer_lifecycle.transition CHECK: OFFERED | SUPERSEDED | WITHDRAWN | APPLIED_WITHDRAWN (EV-17, EV-18, EV-19, EV-21).
control_evidence.kind CHECK: RECONCILIATION_RUN (EV-27).
Idempotency (DISENO 3.6 (g), DEC-28): PK = (event_id, occurred_at), because PostgreSQL requires the
partition key in any unique constraint; duplicates carry the same envelope occurredAt (ON CONFLICT DO NOTHING).
FKs to summary_provenance are logical: SummaryViewed can arrive before ChangeSummaryReady.
summary_view
(partitioned by month)
● event_id : uuid «PK»
● occurred_at : timestamptz «PK, partition key»

Indexes -> access pattern (DISENO S6 (c)):
summary_view(summary_id) -> AP-L1 evidence by summaryId
decision(engagement_id, occurred_at) -> AP-L2 by engagement and date range
decision(user_id, occurred_at) -> AP-L3 by user and date range
partition pruning on occurred_at -> AP-L4 daily batch for sealing
PK summary_provenance(summary_id) -> SX-06 reconstruction (local provenance)
outbox(created_at) WHERE state='PENDING' -> relay of AuditBatchSealed.v1 (ADR-019, DISENO 3.8.3)
Old partitions exported to Parquet in S3 Object Lock (compliance mode, retention T_ret, SUP-11).
Residency: PER CELL (regional WORM, KMS per cell). summary_provenance is a non-confidential copy of EV-05.
